ÖNSÖZ

Yüksek lisans tezi olarak hazırlanan bu çalışmada 8 kat ve bir bodrumdan oluşan bir yapının yatay ve düşey yükler altında statik ve betonarme hesapları TS 500'e göre yapılarak , gerekli kalıp planları çizilmiş ve donatı detayları gösterilmiştir. Sistemin statik hesapları SAP90 bilgisayar programıyla, betonarme hesapları ise uygun tablolar ve abaklardan yararlanılarak yapılmıştır.

Bu çalışmada yakın ilgi ve değerli yardımlarını esirgemeyen Sayın Hocam Prof. Dr. Nahit KUMBASAR'a ve yüksek lisans öğrenimim sırasında değerli bilgilerinden ve çalışmalarından yararlandığım Yapı Anabilim dalının tüm öğretim elamanlarına ayrıca tüm öğrenim hayatım boyunca bana desteklerini hiç esirgemeyen aileme sonsuz teşekkürlerimi sunarım.

ÖZET

Bu çalışmada çok katlı bir betonarme yapının statik ve betonarme hesapları yatay ve düşey yükler altında yapılmıştır.

Yapının statik hesapları SAP90 (Yapı Analiz Programı) bilgisayar programı kullanılarak yapılmıştır. SAP90 bilgisayar programının eğitim versiyonu kullanılmıştır. Bu versiyonun sınırlandırılmış olmasından dolayı yapının tümü tanımlanıp bir seferde çözümlenememiş bunun yerine kısımlara ayrılıp bazı kabüller yapılarak ancak çözülebilmektedir.

Yapı 8 normal kat ve bir bodrum katından oluşmuş bir sistemdir. Yapının bodrum katının çevresi perde duvarları ile çevrilmiştir. Döşeme tipi kat yüksekliğinin sınırlı olmasından dolayı kirişsiz döşeme olarak seçilmiştir. Döşeme kalınlığı 18 cm seçilmiştir. Zımbalamaya karşı S3 kolonlarında başlık yapılmıştır kat yüksekliği 2.72 m dir.

Düşey yükler ve yatay yükler altında TS 500 de belirtilen yük kombinezonları yapılmış ve en elverişsiz durumlar dikkate alınmıştır. Yatay yüklerin yön değiştireceği göz önüne alınarak mesnetlere gerekli ek donatı konulmuştur. Yatay yük hesabında simetri dikkate alınarak yapının dörtte biri için hesap yapılmıştır. Yapının temel kısmına tek tip temel uygulanmıştır. Radye temel uygun görülmüştür.

Radyenin statik hesabı döşemeye benzetilerek SAP90 bilgisayar programı ile yapılmıştır.

STATIC AND REINFORCED CONCRETE CALCULATION OF A MULTI-STOREY BUILDING

The static and reinforced concrete calculation of a multi-storey building under vertical and horizontal loads are made as a master thesis.

Software SAP90 (Structural Analysis Program) are used for the static calculations. The reinforced concrete design is made by using tables prepared to design all kinds of reinforced concrete structures.

The building has a reinforced concrete skeleton, eight normal storeys and one basement storey . Basement is surrounded by shear wall.

Building support system is composed of columns , shear walls, a core in which elevator hall is located and slabs without beams. Because height of storeys are limited ,slab without beams is chosen ,slab thickness is chosen 18 cm. Height of normal storeys are 272 cm.

To check the computer solutions, one axe is calculated by using equivalent frame method.

The solution of slab is calculated by using SAP90's (Structural Analysis Program) shell data . Slab is divided in small pieces and crossing points of slab elements are called crucial nodes and numbered. Because program is limited, normal storey's slab are divided into big pieces by using symmetry.

The following assumption are made while determining the border conditions of the slab.

1. The crucial points on the column and shear wall are restricted to displacements
2. The other crucial points are not allowed to displace in x and y directions.
3. A long the axis dividing the slab's grid members do not rotate around it's axis.
4. Side of beams do not displace .

Another calculation for the system under vertical and horizontal loads are made and cross section effect which are accrued on columns and shear walls are determined. The structure is defined totally as a three dimensional frame which is composed of equivalent beams which connects columns and shear walls. Calculations results is superposed by the result under horizontal loads.

Calculating of lateral loads;

The building which is in the 4th degree earthquake area and the purpose of usage is as a residence and ylong is used in the building wall.

The first step is to calculate the weight of the building

$$N_i = G_i + n \times Q_i$$

n is taken 0.3 because the purpose of usage is as a residence.

$$W = \sum W_i \text{ (The weight of building)}$$

The second step is to calculate the coefficient of earthquake

Co: The coefficient of earthquake zone
 K: The coefficient of frame elements type
 I : The coefficient of building importance
 h: Height of building
 C: Building wide in the earthquake forces direction
 N: Number of floors

$$T < (0.09 H) / \sqrt{D}$$

$T < (0.07 \sim 0.1) N$ the coefficient of N is depend on rigidity of building

$$S = 1 / | 0.80 + T + T_0 | \quad S < 1$$

To: Takes from the table [3]

The third step is to calculate total lateral force.

$$F = C.W$$

The last step is to calculate forces which influence to floors

$F_t = 0.004 F(H/D)^2$ $F_t < 0.15 F$; $H/D < 3 \rightarrow F_t = 0$
 F_t is just for the last floor

$$F_i = (F - F_t) (W_i \cdot h_i / \sum W_i \cdot h_i)$$

These coefficients are used for semi-dynamic earthquake design forces.

F_i forces determined are divided into two axes of the structure and calculations carried out for earthquake forces action in two direction perpendicular to each other of the building.

Reinforced concrete design of the building is made by using the most unfavourable cross section effect resulted from loads due to earthquake and vertical loads. Reinforced concrete design of the beams in the building is done by the use of cross section effects of the beams at opening and support points and reasonable amount of bar determine from calculation is exceeded the minimum bar required which is

$$\min A_s = (12/f_y d) b_w d$$

If the magnitude of the shear stresses of beams at the point which have a distance from the support surface is greater from the magnitude of

$$V_{cr} = 0,65 f_{ctd} \cdot b_w \cdot d$$

Reinforced concrete design of beams are made by taking shear forces into consideration.

The minimum dimension of the rectangular cross section of columns of the building design is 30 cm. The thickness of concrete cover exposed to outside effects is chosen to be 2 cm.

Wrapping horizontal bar around vertical bar, sprain of vertical bar of columns is restricted and vertical strength of columns is increased. Diameter of shear bar used the condition below.

$$\phi_t > \phi / 3, s \leq 120, 20 \text{ cm}$$

ϕ_t : The diameter of shear bar

ϕ : The diameter of vertical bar

s : Length between two shear bar.

Reinforced concrete design of the columns carried out by using tables reinforced concrete design of shear walls in the

building is made like design of columns and appropriate amount of bar is placed in shear walls.

For the foundation a mat slab is designed like slab without beams. It is calculated by using SAP90 computer software.

BÖLÜM 1.GİRİŞ

Yapılar kat adetleride göz önünde bulundurularak taşıyıcı sistemleri o şekilde seçilirki düşey ve yatay yükler altında en uygun çözüm elde edilsin. Bu en uygun çözümü elde etmede genellikle analitik ve yaklaşık yöntemler olmak üzere çeşitli yöntemler kullanılır. Bu yöntemlerle çözümü yapılamayan veya yaklaşık olarak ancak çözülebilen sistemler bilgisayarın gelişmesi ile birlikte geliştirilen yeni yöntemlerle tamamen veya bazı durumlarda yaklaşık olarak çözülebilmektedir.

Bu çalışmamızda 8 kat ve bir bodrumdan oluşan yapı sisteminin taşıyıcı sisteminin projelendirilmesine çalışılmıştır. Döşeme tipi kirişsiz döşeme olarak belirlenmiştir. Kirişsiz döşemeler arada kirişler olmadan doğrudan doğruya kolonlara oturan eğilmeye çalışan çift doğrultuda donatılı betonarme plaklardır.

Kirişsiz döşemelerin gerek hesap gerekse inşaatlarının basit ve kolay olması ve özel problemlerin çıkması için düzgün sıralanmış birbirine dik eksenler üzerindeki kolonlara oturmalıdırlar. Ayrıca her iki doğrultuda da en az üç açıklığın bulunması ve kenar açıklıkların iç açıklıklara göre biraz küçük düzenlenmesi momentlerin dengelenmesi bakımından önemlidir.

Bu çalışmada simetriden yararlanarak sistemin dört -tebiri alınmış ve bazı kabüller yapılarak sistem hesaplanmıştır. Sistemin hesaplarında bilgisayardan yararlanılmıştır.

Sistemin hesaplarda ölü yükler, hareketli yükler ve deprem yükleri, yük katsayıları ile çarpılmış ve en elverişsiz olanları dikkate alınarak, kesit hesapları yapılmıştır. Kesit hesaplarında TS 500 göz önünde bulundurulmuştur. Hesaplarda kullanılan yükler TS 498'den alınmıştır. Deprem etkileri ise Afet Bölgelerinde Yapılacak Yapılar Hakkındaki Yönetmeliğe göre hesaplanmıştır.

Hesapların yapılışında yük aktarma sırasına uygun olarak döşemelerden başlanmıř ve temellere doğru bir sıra izlenmiştir. Hesap yöntemi olarak taşıma gücü kullanılmıştır.

3.3.Merdiven Kesit Tesirleri Hesabı

yük analizi

Döşeme öz ağırlığı	: 0.180 x 2.4	= 0.432
Basamak ağırlığı	:	= 0.100
Tesfiye betonu	: 0.030 x 2.0	= 0.060
şap	: 0.025 x 2.0	= 0.050

$$\text{sabit yük} = 0.642 \text{ t / m}^2$$

$$pd = 1.4 \times 0.642 + 1.6 \times 0.350 = 1.459 \text{ t / m}^2$$

$$W = 1.459 / 0.18 = 8.104 \text{ t / m}^3$$

3.3. Merdiven Kesit Tesirlerinin Bulunması

3.3.1. Merdiven SAP90 Giriş Verileri ve Çıktıları

Merdiven kısmı için SAP90 veri bloku oluşturulup hesaplar yapılmıştır ve kesit tesir değerleri elde edilmiştir.

BÖLÜM 4. KESİT HESAPLARI

4.1. Döşeme Betonarme Kesit Hesapları

Kirişsiz döşemelerde momentler kolon ve açıklık şeritlerine paylaştırılmaktadır. Kolon şeridi genişliği 1/4 I1 veya 1/4 I2' den küçüğü alınarak belirlenir. Açıklık şeridi iki aks arasından kolon şeridinin dışında kalan kısımdır.

Burada kolon şeritlerine yatay yükten gelen etkide dikkate alınarak en elverişsiz yük durumu elde edilmiştir.

4.1.1. Döşemenin X Doğrultusunda Kesit Hesapları

$$h_f = 18 \text{ cm}$$

$$d = 18 - 2 = 16 \text{ cm}$$

$$k_d = d / \sqrt{(10 M_{sd} / b)} \Rightarrow k_s [4]$$

$$a_s = k_s M / d$$

$$[d]: \text{cm}$$

5.5. S3 Kolonları İçin Zımbalama Tahkiki

$$V_{pd} \cong 165 - (1.02 \times 1.22) \times 20.70 = 139.24 \text{ t}$$

$$e_x = 0.625$$

$$e_y = 0.225$$

$$\alpha = 1 / [1 + 1.5 \times (0.625 + 0.225) / \sqrt{(1.02 \times 1.22)}] = 0.466$$

$$V_{cr} = \gamma \cdot f_{ctd} \cdot U_{pd} = 0.466 \times 1.15 \times 2 \times (1.02 + 1.22) \times 0.72 = 172.85 \text{ t}$$

$$V_{cr} = 172.85 > V_{pd} = 139.24 \quad \text{sağlar}$$

SONUÇ

Sonuç olarak diyebilirizki bir yapıda perdelerin bulunması, o yapıdaki kolonların kesit tesirlerini azaltmakta ve dolayısıyla kolon kesitleri küçük tutulabilmektedir. Ayrıca kat yüksekliğinin sınırlı olduğu durumlarda kirişsiz döşeme yapılması uygun olmaktadır. Kirişsiz döşeme yapılması durumunda hesaplar çok dikkatli yapılmalı zımbalama etkisine dikkat edilmelidir.

Bilgisayarla yapılan hesapların hızlı ve bazı kolaylıkları nedeniyle yaygın olarak kullanılmalarını sağlamaktadır. Fakat bazı durumlarda bilgisayar kullanılmadanda kolaylıkla hesap yapılması mümkünken bilgisayar alışkanlığı nedeniyle hep bilgisayar kullanılmaya yönelinmektedir. Ayrıca bilgisayarla yapılan tüm hesaplar doğrudur yaklaşımında yanlıştır. Bilgisayarlar kendilerine verilen değerlere bağlı olarak hesap yapmaktadır. Girilen degerler yanlışsa elde edilen degerlerde yanlış olmaktadır. Bu nedenle bilgisayar sonuçlarına körü körüne bağlanmak yanlış olacaktır.
